

Student-Led Charitable Robotics & Maker Initiative

Hyderabad, India · 2025–26

WHO WE ARE

Building a generation of makers

Bot Works is a student-led robotics and maker organisation founded and run by IB Diploma students in Hyderabad. We operate at the intersection of competitive engineering, charitable impact, and open-source contribution, not as three separate programs, but as one unified culture expressed in different contexts.

We as an organisation are new. Build24 is our founding public event. We do not claim heritage we have not earned, but the students behind Bot Works have competed internationally, built real hardware, and are now channelling that experience, and have run student-run events into something that outlasts any individual competition result.

We hope to foster a sense of curiosity and passion within students and provide a platform for making both hardware and software solutions, in the ever-evolving world, a platform where they can learn, grow and express their passion and understanding for engineering, and grow with it.

Bot Works is not primarily a school club under school jurisdiction, it is a Oakridge International School student founded & associated, student-initiated, student-operated, and student-accountable.

Adults supervise and advise, whose contact details will give per procedure. Students have put forward, decided and executed the ideas and the further action needed for such.

We operate as a student-led NGO, with all charitable acts being under the (in process of registration) associated registered trust, and all non-charitable initiatives being legally separate and self-run unless specifically backed by other partners and sponsors, not related to the trust's operations or finances.

WHAT WE STAND FOR

Two pillars. One organisation.

Competitive

We believe in the power of competitive engineering to forge exceptional technical talent. This is not about mere participation, it is about rigorous development under pressure. Our teams have already demonstrated this commitment by representing India at the World Robot Olympiad (WRO) in both 2023 and 2024, an event that demands innovation, precision, and problem-solving capabilities from participants across 97 countries. Competition serves as our real-world training ground, allowing our students to develop sophisticated technical skills from complex design to rapid prototyping in an environment where only authentic, functional solutions succeed.

The experience gained from this has taught our team far, in magnitudes of understanding, communication and operation, experience that far surpasses theoretical drills or simulated challenges.

WRO 2024 FUTURE ENGINEERS CAR

Charitable

The pursuit of technical excellence is fundamentally tied to meaningful community impact. Bot Works is dedicated to leveraging the skills and hardware we build to address tangible societal needs. Our commitment is embodied by initiatives like Project Reboot, our flagship charitable program focused on digital equity.

Through Project Reboot, we are re-doing our efforts, by acquiring, refurbishing, testing, and deploying functional laptop computers to students in underserved communities who lack essential access to digital learning tools. This direct community engagement transforms our technical output into quantifiable social good. By supporting Bot Works, sponsors are not just funding engineering projects; they are directly investing in sustainable educational access and tangible e-waste mitigation, creating a clear and documented benefit for the community.

Note that a further detailed document exists for further details regarding charitable projects.

50+ Students impacted in only 1 month

A Commitment Open Source.

As a core pillar of our philosophy, Bot Works maintains a commitment to open-source contribution and intellectual honesty. We are dedicated to ensuring that every piece of technology, code, or documentation we create that is sharable is made publicly available. This includes detailed schematics, fully documented install guides, and all underlying codebases. This practice serves two crucial purposes: first, it actively contributes to the global maker and engineering community, fostering a culture of shared knowledge and accelerated learning. Second, it serves as an open signal of transparency and integrity, allowing our partners and the public to examine the depth and quality of our work firsthand.

Charitable projects will also have public and continued documentation and relevant event details, either directly on social media or to any future sponsors and partners.

TRACK RECORD

Where we have competed

Our founding members bring direct international competition experience from the World Robot Olympiad the world's largest student robotics competition, spanning 97 countries, where we represented our school and state nationally and received a top 5 (in 23') ranking and merit, with former name of DIRT-LABS for operations, we decided to remain dormant for a year to re-think the approach and domain to expand beyond just a robotics exercise.

Using creativity and critical thinking to identify a major future gap in the current logistics market for semi-rural areas in India for critical media goods, and created an iterative prototype VTOL Drone, demonstrating the team's ideation and development capabilities, with a real-life demonstration aircraft created.

How we plan to continue in terms of robotics

With the same team that ran the digital-education drive and WRO team, we plan to revamp the platform under Bot Works as a fresh start to re-document the effort and be able to plan to fund the effort using current resources, re-establishing our presence in competitive robotics.

As of current, **No sponsorship amount is going to be allocated to the competitive robotics** effort as its re-establishment is in the development phase, and we do not think funds are relevant or related to the current initiatives under taken, mainly being the *Build-24 Hackathon & Bot Works - Charitable Initiatives*.

COMMUNITY & EDUCATION

CAS: making participation meaningful

Bot Works is structured so that meaningful participation simultaneously satisfies the IB Diploma Programme's CAS (Creativity, Activity, Service) requirements, requiring about 150 hours of documented effort on behalf of IBDP students, documented as entries. This is intentional, as part to ensure student dedication but maintain impact and intent, as this also acts as platform for students to fulfill and complete these entries while giving meaningful and real help for the people who need it, while still having a technological focus.

IB students are time-constrained. We designed the club so that contributing to real projects counts. Every major Bot Works initiative hits all three CAS strands:

C	A	S
Creativity	Action	Service
Designing, building, communicating, creating campaigns and documentation	Physical making, refurbishing hardware, prototyping, hands-on engineering	NGO partnerships, community benefit, digital equity, public documentation

This is what obligates us to build towards the primary foundational CAS projects, Project Reboot and the Alzheimer's recognition development project.

Both have a direct impact on underserved communities who are suffering or shall suffer from a lack of help now, and we aim to build towards such in the best manner possible.

Do find or request the Charitable Projects document for further details regarding *Bot Works - Charitable Initiatives*.

OUR FOUNDATIONAL EVENT

Build24 is the flagship founding event of Bot Works, a 24-hour build challenge bringing together student makers, engineers and developers to design and build working solutions to real-world infrastructure problems. The event runs two simultaneous tracks, hardware and software, with teams competing in one or both. The scale of the event, from 40 to 100 participants, is directly tied to the support we receive, because more funding means more students, better kits, and a bigger stage for ideas that actually matter.

Every project built at Build24 is anchored to SDG 9, Industry, Innovation and Infrastructure, with the full challenge brief revealed at kickoff to test not just technical skill but adaptability. Teams are judged on what they build, working prototypes and functional software, not slide decks. Three awards are given across Best Hardware, Best Software and Best Overall, and any surplus beyond event costs goes directly into Bot Works' year-round community programmes, so your support does not stop when the 24 hours do.

WHY PARTNER WITH US

Sponsoring Bot Works

We are at the beginning. That is the point. Sponsoring Bot Works now is not supporting something that has already succeeded; it is being part of the origin story.

As a founding partner of Bot Works, your organisation is credited not just at Build24, but across all future activity the club runs competitions, community programmes, and publications for as long as the club operates.

We have a full commitment to our sponsors and partners and are willing to cooperate in any way needed to ensure clarity and procedure to benefit everyone involved, having an open and transparent communication policy, further the maker, and open source cause, and pushing forward with charity to reach those who need it and push the spirit to those who may not have otherwise got the chance.

Our founding partners did not fund just an event. They also fund everything that will come next.

For organisations with CSR obligations under the Companies Act 2013, Bot Works projects qualify under Schedule VII, spanning education, digital equity, and e-waste categories. We provide a full impact report with photographs, beneficiary data, and social media documentation suitable for CSR filing.

We are in the process of separately registering the Charitable Initiative section as a separate legal entity, and plan to partner with a registered charity to ensure we can meet our charitable goals and CSR fulfilment.

Get in touch

We welcome conversations about funding structure, project involvement, or what a partnership with Bot Works can look like for your organisation.
